CONNECTOR ARRANGEMENT FOR A COMMUNICATION TERMINAL

Abstract of the Disclosure

A radio communication terminal includes a user input and output interface. The terminal includes a terminal core having a main terminal PCB carrying electronic circuits with a data processor for controlling terminal functions and a system connector. A cover connector is connected to the data processor. A releasable cover carries an auxiliary functional member and a terminal connector connected to the auxiliary functional member. The cover connector and terminal connector are configured to provide communicative connection for the auxiliary functional member of the cover to the data processing means of the terminal core. The terminal core includes an additional keyboard PCB supporting a terminal keyboard connected to the electronic circuits, and the cover connector is disposed on the additional PCB.
